

Boss Buck Control System Directions

Step 1: Attach wire harness to the digital timer.

Step 2: Connect the two prong plug from the motor, to the matching plug on the wire harness for the timer.

Step 3: Attach the solar panel unit to the control box so that the wires are inside the control box.

Step 4: Install battery on the right hand side of the control box. Face the top posts to the front. Plug the piggyback connectors from the solar panel wires to the positive and negative posts on the battery.

Step 5: Attach the two clips from the timer, to the piggyback clips on the battery posts.

Note: The arms of your control system are adjustable. Set the pre-installed slinger to 1/8" or 1/4" past the funnel spout. This will keep Raccoons and Squirrels from flipping the gates open and throwing off the balance of your system. Tighten the wing nuts firmly so the vibration won't loosen them over time.
